In the theory of stochastic processes, the filtering problem is a mathematical model for a number of state estimation problems in signal processing and related fields. The general idea is to establish a "best estimate" for the true value of some system from an incomplete, potentially noisy set of observations on that system. The problem of optimal non-linear filtering was solved by Ruslan L. Stratonovich, see also Harold J. Kushner's work and Moshe Zakai's, who introduced a simplified dynamics f

This book presents a unified treatment of linear and nonlinear filtering theory for engineers, with sufficient emphasis on applications to enable the reader to use the theory. The need for this book is twofold. First, although linear estimation theory is relatively well known, it is largely scattered in the journal literature and has not been collected in a single source.

Taking the state-space approach to filtering, this text models dynamical systems by finite-dimensional Markov processes, outputs of stochastic difference, and differential equations. Starting with background material on probability theory and stochastic processes, the author introduces and defines the problems of filtering, prediction, and smoothing.

Stochastic Filtering is a very general (Bayesian) framework for sequential estimation in a model-based setting. For linear and Gaussian models the densities being propagated have a closed-form solution and the result is simply the well known Kalman filter. When using non-linear models closed-form solutions

This unified treatment of linear and nonlinear filtering theory presents material previously available only in journals, and in terms accessible to engineering students. Its sole prerequisites are advanced calculus, theory of ordinary differential equations, and matrix analysis. Although theory is emphasized, it discusses numerous practical applications as well. 1970 edition.

This is suficient do develop a large class of interesting models, and to developsome stochastic control and ltering theory in the most basic setting. Stochastic integration with respect to general semimartin-gales, and many other fascinating (and useful) topics, are left for a more advanced course.

The stochastic filtering problem or non-linear filtering problem is to determine the conditional probability distribution of a process given the past of a related process. The linear filtering problem has first been formulated and solved by N. Wiener and A.N. Kolmogorov . R.E. Kalman has reformulated the linear filtering problem for a stochastic system in state space form.
